Incorporating known risk factors into models

Jiaxuan Wang

<2017-02-07 Tue>

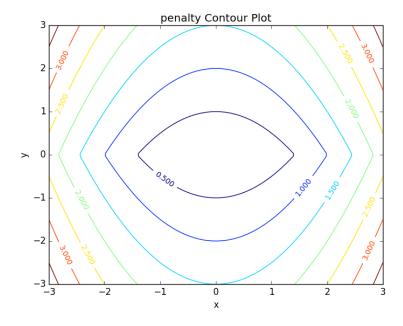

1 objective

Incorporating known risk factors with unknown risk factors in predicting outcome. In the case of choosing between correlated variables, the model should favor known risk factors.

2 approaches taken

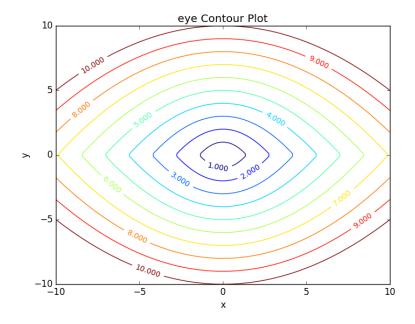

2.1 old approach

0.5 *
$$\lambda_2$$
||r * θ ||^2 + λ_1 ||(1-r) * θ ||_1 where r \in {0,1}|d, θ \in R^d

2.2 new approach

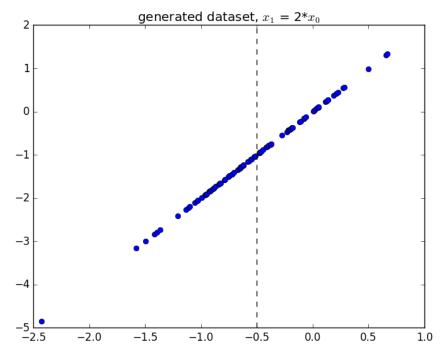

fix a convex body that have property of the previous contour plot such that the angle at the end point is 45 degree. The following is the contour plot of its induced norm

3 experiments

3.1 set up

Data n=100:

 $x_0 \sim N(-0.5, 0.5)$

 $x_1 = 2 * x_0$

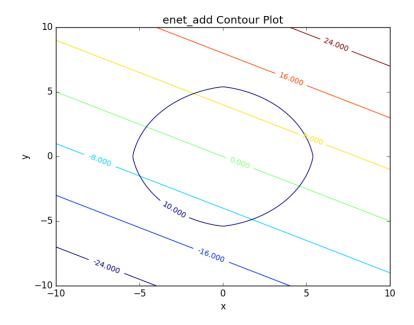

Loss function is the negative loss likelihood of the logistic regression model.

Optimizer: AdaDelta Number of Epoch: 1000

Regulizers: elastic net, lasso, ridge, $\operatorname{OWL},$ weighted lasso, weighted ridge, our penalty

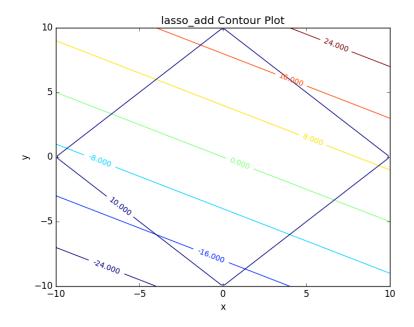

3.1.1 elastic net

 α * (c * ||\theta||_1 + 0.5 * (1 - c) * ||\theta||_2^2) where c is a scaler

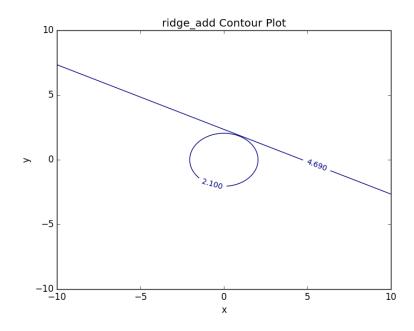

3.1.2 lasso

 $\alpha * ||\theta||_1$

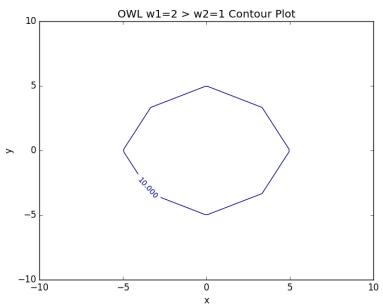

3.1.3 ridge

 $0.5 * \alpha * ||\theta||_2^2$

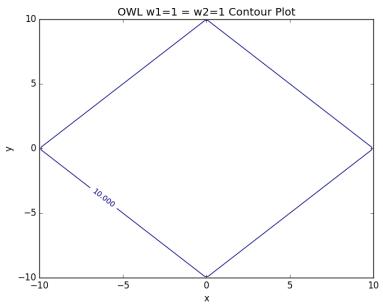

3.1.4 OWL

 $\alpha * \sum_{i=1}^n w_i \; |x|_{[i]}$ where $w \in K_{m+}$ (monotone nonnegative cone)

 $w1{=}2>w2{=}1.png$ degenerated case: back to lasso

 $w1{=}1=w2{=}1.png$ degenerated case: back to l_{\inf}

w1=2 > w2=0.png some properties:

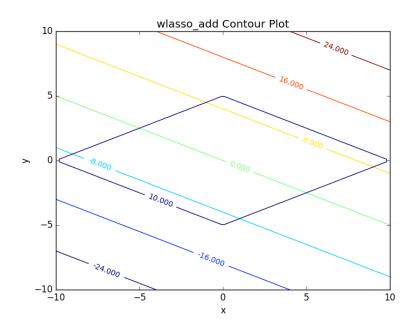

generalization of OSCAR norm

symmetry with respect to signed permutations

in the regular case, the minimal atomic set for this norm is known (the corners are easily calculated)

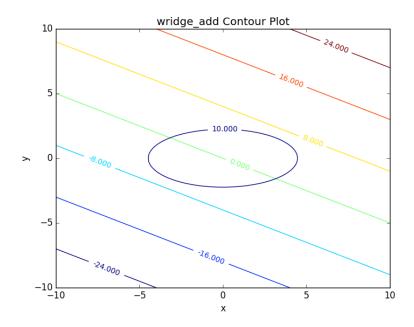

3.1.5 weighted lasso

$$\alpha * ||\mathbf{w} * \theta||_1$$
 where $\mathbf{w} \in \mathbf{R}_+^d$

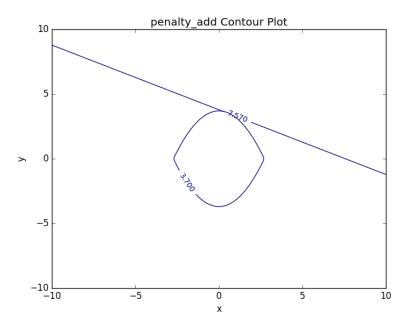

3.1.6 weighted ridge

0.5 * α * ||w * θ ||^2 where w $\in R^d_+$

3.1.7 our penalty

 α * (0.5 * (1-c) * ||r * θ ||_2 + c * ||(1-r) * θ ||_1) where r \in {0,1}^d, $\theta \in R^d, \, \alpha \in R, \, c \in R$

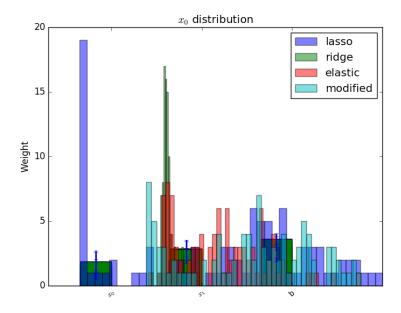

3.2 running procedure

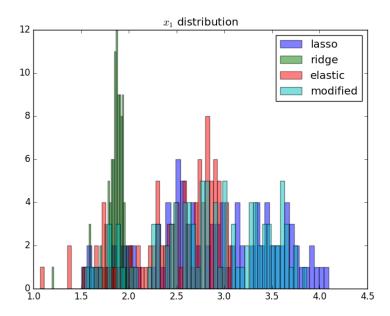

3.2.1 first run

b regularized

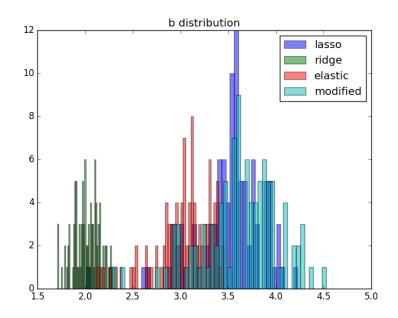

fix hyperparmeters to predefined value repeat the following 100 times: generate data, run the selected regularizers, record θ

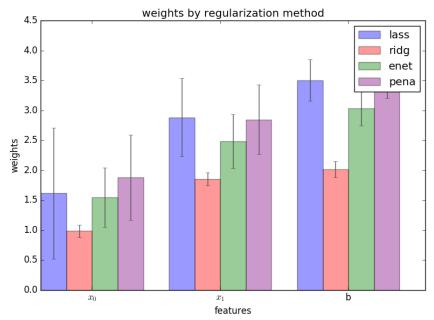

${\it distribution.png}$

 ${\it distribution.png}$

${\it distribution.png}$

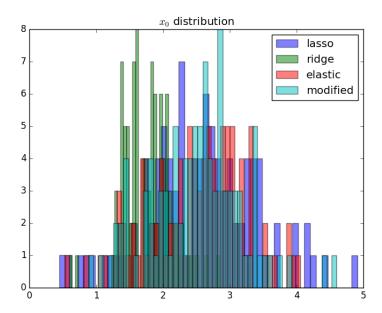

3.2.2 second run

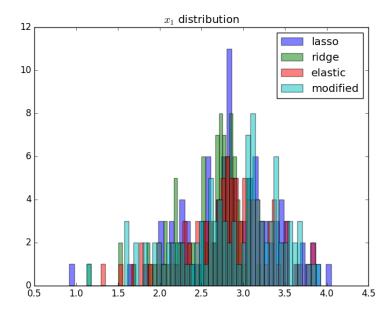

b unregularized

generate two datasets, one for training, one for validation parameter search over the different hyperparams of the regularizers for each regularizer, use the hyperparmeters that acheives the minimal loss

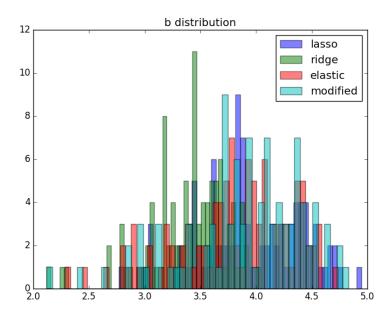

repeat the following 100 times: generate data, run the selected regularizers, record θ
